

# GV BV-1 Chassis

## Radio System.

For detailed instructions on the use of your radio control system, please refer to the included radio instructions in conjunction with the instructional video.

1. Make sure that the receiver antenna is unraveled and installed correctly in the antenna tube.
2. Use fresh batteries and check them regularly. Flat batteries **will** cause a total loss of control of your vehicle.
3. Double check the radio installation as per the instructional video.

## Engine.

The engine in your Awesome R/C Products vehicle will give many hours of reliable service if maintained and run in correctly.

1. Refer to the instructional video on correctly running in and tuning your engine.
2. Always use a good quality commercial fuel such as Model Engines Glow Max fuels.
3. **Never** run the engine without an air cleaner fitted.
4. Clean and/or replace the air cleaner element regularly.
5. **Do not** fit the body during the critical running in period. This allows the engine to run cooler.
6. **Never** over lean your engine, which leads to overheating. Again refer to the video for tuning instructions.

## Starting.

The instructional video contains vital information on engine starting and trouble shooting. The key points are:

1. **Do not** over prime the engine. This will cause the engine to flood. Only prime the engine until the fuel reaches the carburetor.
2. Make sure the glow plug has a bright orange glow. If not, replace the glow plug and/or check the condition of the starter battery.
3. Use short, quick pulls on the starter (10—15cm). **Do not** pull the starter to the end of the cord.

## Suspension Fine Tuning.

Being a race bred chassis, the handling of your Awesome R/C products vehicle can be fine tuned to suit a variety of tracks and conditions. **It is recommended that you seek the advice of an experienced racer before adjusting the suspension settings of the vehicle.** Even small changes can produce dramatic changes in the cars handling.

## Toe In/Out.

The toe in and toe out of the front and rear suspension can be adjusted.

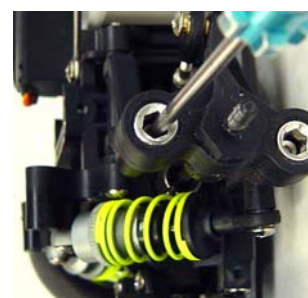

*Front suspension*

The toe in and toe out of the front suspension is adjusted by lengthening or shortening the steering arm. Turn the ball link anti clockwise to lengthen and clockwise to shorten. Make sure that both sides are adjusted equally.

*Rear suspension*

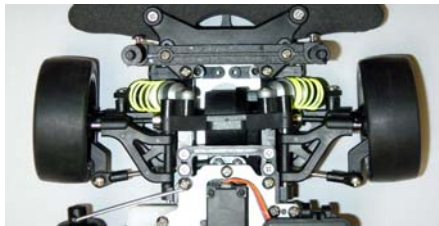

The toe in and toe out of the rear suspension requires the use of 'allen' or 'hex' keys. Again make sure that both sides are adjusted evenly and just firm enough to ensure there is no slop in the suspension.

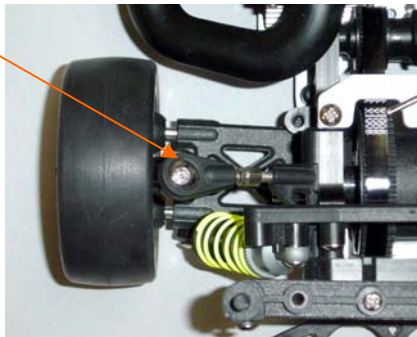

*Suspension without toe in.*

*Suspension with toe in.*

## Camber Adjustment.

The camber on the rear suspension is adjusted by lengthening or shortening the rod on top of the rear suspension.

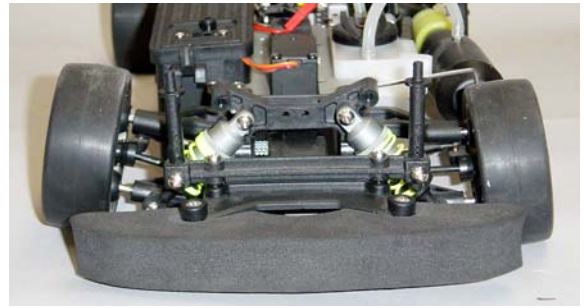

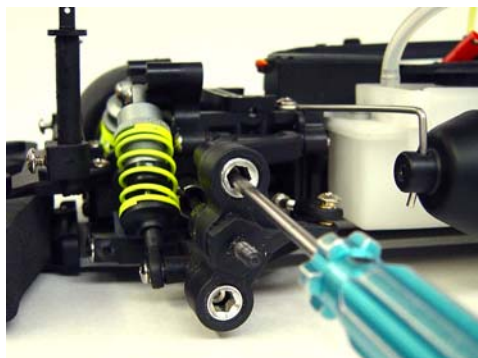

*Rear Suspension*

The camber of the front suspension is adjusted with the use of 'allen' or 'hex' keys.

*Front Suspension*

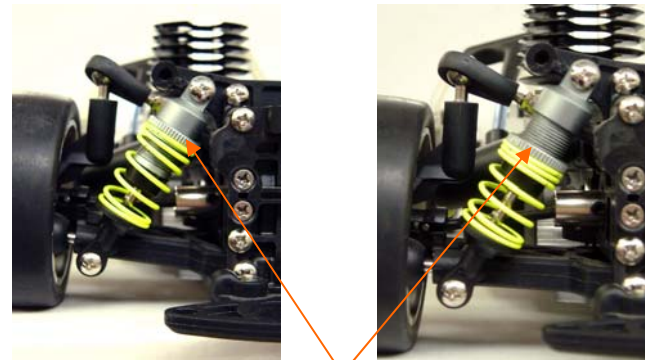

As with all adjustments, make sure both sides are adjusted evenly and there is no unwanted slop in the suspension.

*Suspension with camber adjustment. Adjustment is exaggerated for illustrative purposes.*

## Chassis Ride Height.

The ride height adjustment is a combination of the shock absorber adjustment screw and the travel limit grub screws. It is worth noting that adjusting the shock absorber adjusting screw will also soften or firm up the suspension. **Again seek the advice of an experienced racer before making these adjustments**

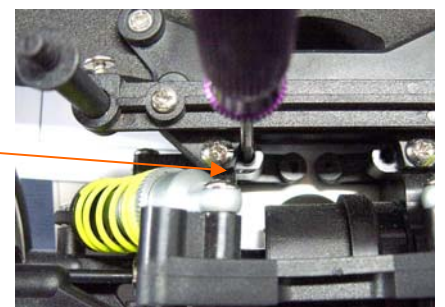

*Shock absorber adjustment screw.*

*Rear travel limit grub screw.*

*Front travel limit grub screw.*

## Optional Parts.

**VX225** — 2 speed conversion kit.

**VX3612** — Front stabilizer rod set.

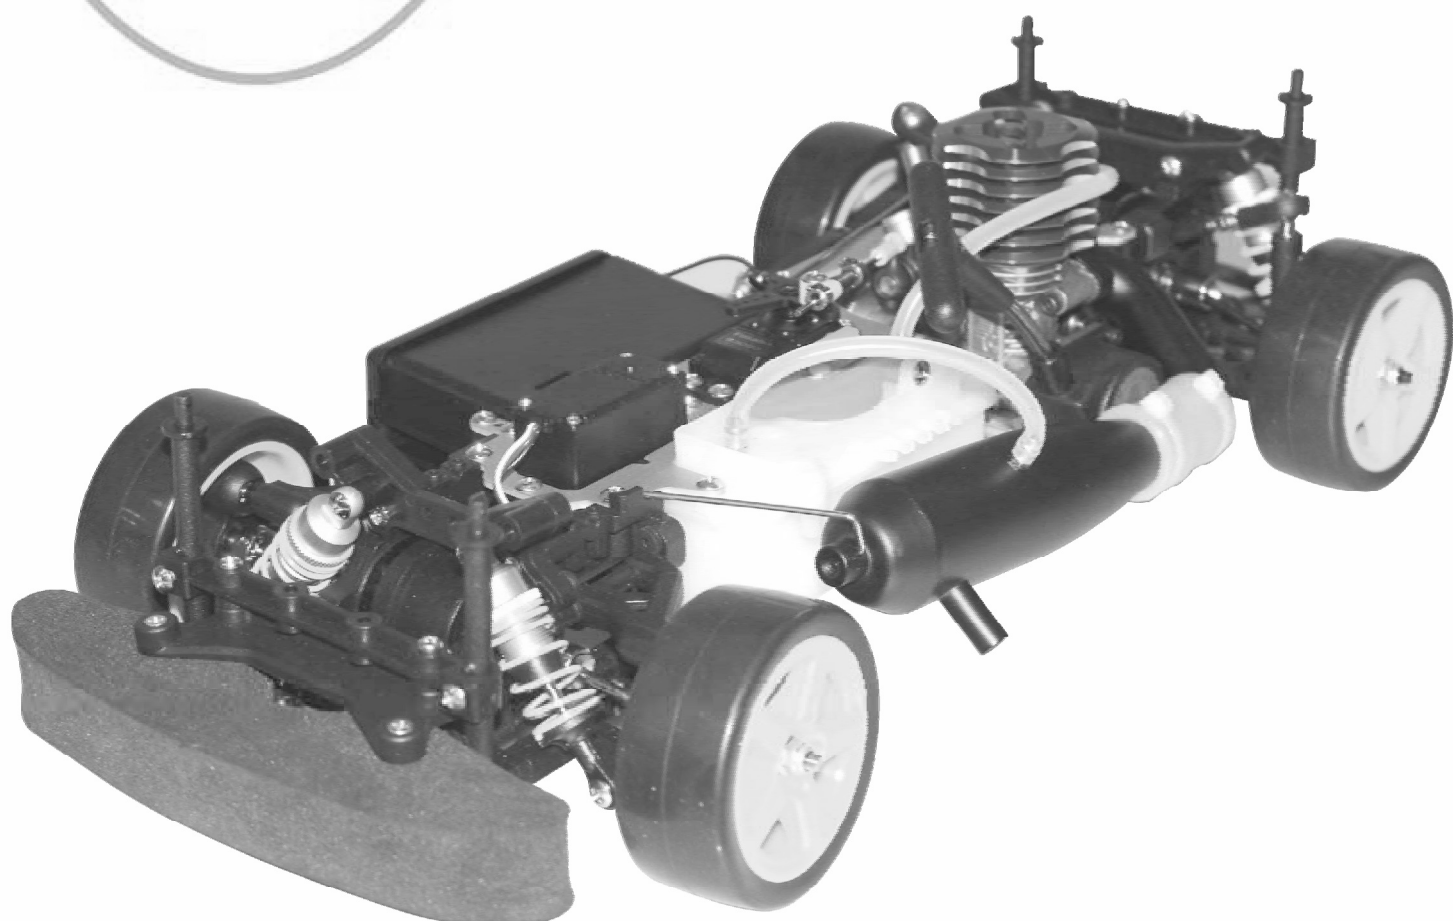

**VX3613** — Rear stabilizer rod set.
